

## Engineering Career Talk – 29 November 2018

'An incredible talk, by a marine mechanical engineer, provided a very useful insight about the different career routes to explore, within the field of engineering. Although the talk had an emphasis on marine engineering, it was still extremely useful to understand what marine engineering entails, which is a career within engineering that not many people would have thought of pursuing. Overall, not only was this talk very informative, but it was also very inspiring to see a female engineer who is so passionate about her job.' **By Daniella Khalastchi in year 12**

'The term engineer is very broad, and Stephanie Ryder explained the wide range of things engineers do. It surprised me that there were so many different types of engineers and that each type has a diverse impact on the world. I had thought that all engineers did was design cars, but Stephanie's talk really opened my eyes to how wrong I was. Stephanie is a marine engineer and helping to make a new efficient way to travel and deliver coal by sea. The talk highlighted the wide range of jobs you can get as an engineer. Stephanie explained how she started working at a brewery and then progressed to work in the oil and gas industry. I found this fascinating as she explained how although the jobs were different, the skills were transferrable. Overall the talk was very interesting and I was really inspired by the impact engineers have on the world. Perhaps one day I could become an engineer in the future.'
